

Got it. You want the commands to dump your current Termux environment details so you can feed them back to me.

Copy and paste this entire block into Termux and hit enter. It will print out your current working directory, the files you currently have, your installed Termux packages, and your Python setup.

```
clear && echo "=== CURRENT LOCATION ===" && pwd && echo -e "\n=== DIRECTORY CONTENTS ===" && ls -la && echo -e "\n=== INSTALLED TERMUX PACKAGES ===" && pkg list-installed && echo -e "\n=== PYTHON ENVIRONMENT ===" && command -v python >/dev/null 2>&1 && python --version && pip freeze || echo "Python not installed"
```

Once it runs, copy all the output it spits back at you and paste it here. That will give me the exact blueprint of your setup.
